

STOMACH REFLUX

Bioactive Research has models available for investigating the potential of products and preparations for alleviating stomach reflux. The origin of this condition is frequently in the stomach and the contents of the stomach are regurgitated and may pass beyond the oesophagus.

Using human stomach epithelial cells and oesophageal epithelial cells Bioactive Research can set up experimental conditions that stimulate the situation they are exposed to during reflux. Studies involving these are designed to address the specific questions associated with the investigation.
